

Q1 | How many members are currently on the team? Are there any plans to expand the team to speed up development? What is the source of the team's salary? What is the current funding progress?

A: Currently, we have four people covering front-end, back-end, and AI, as well as a technical architecture advisor. Salaries are currently funded through DAOS.fun. We are also in contact with VCs and investors for further funding.

Q2 | How long will full game development take? When can we start marketing? What about the tokenomics?

A: The game development timeline is currently unknown. Our main direction focuses on AI. As for tokenomics, the E3A token will be the sole currency in the future virtual world. It will be used for material trading, daily necessities, etc. Even account registration after public testing will require spending E3A tokens to purchase basic computing power for characters within the world.

Q3 | How many technical members are there? Can you briefly describe the team background? Is there any marketing?

A: This question has been introduced on our official Twitter. We recommend following our content closely. Thank you 😊

Q4 | When will the 3D version of the game be released?

A: This is currently not in the development plan due to lack of funding. We are more inclined to find an open-source framework or cooperate with a game studio.

Q5 | After the team's 20% token allocation, will there be an airdrop? Will it be locked for one year?

A: The team's 20% token allocation will be used for fundraising and off-market deals.

Q6 | Is there a detailed plan on how the tokens will be used afterward? With 20% for the team and 20% for the DAO, that's already 40%.

A: DAO tokens will likely all be injected into the decentralized bank within the world, with a portion possibly reserved for incentive use.

Q7 | Once the graph RAG is completed, will the game be in its final version?

A: No, the graph RAG is only meant to support the concept of digital immortality and the world's central brain. Our ultimate goal is TI — "True Intelligence": persistent memory, self-planning, continuous evolution, unsupervised learning, and personality continuity.

Q8 | The game has high maintenance costs. What will happen if you can't secure funding?

A: We can temporarily bear this cost. During this time, we will continuously seek investors.

Q9 | Do you think there's not enough hype? Should we invite KOLs to promote?

A: We're building in silence. I prefer to allocate the budget to development and necessary purchases rather than paying KOLs.

Q10 | After RAG and graph RAG are completed, how will the game be played?

A: Personalized character creation (digital immortality)

Persistent interactive AI society
Time system and behavior reasoning
Story co-creation and civilization evolution
Layered gameplay and economic model

Q11 | A newbie guide is needed

A: I'll take note of that. Once RAG is ready, we'll release a beginner's tutorial.

Q12 | When will the bugs be fixed?

A: Known issues are expected to be fixed next week. Aside from that, we're also working on other optimizations.

Q13 | The development pace seems a bit unclear

A: It's okay. We announce each phase as we go, along with the next steps.

Q14 | The product currently has very little trading volume, but some long-term holders are still selling. This shows there were expectations for the product, but there has been no promotion. In Web3, products are usually promoted while being built. During the promotion phase, if a market maker sees potential, it naturally gains traction.

A: We completely understand why this question is being asked. After all, investors want to see returns. But as the old saying goes, "To forge iron, one must be strong."

We need a solid demo before presenting it to VCs or investors.

We are discussing promotion, but results so far have been limited. In truth, the power of the community is massive. We also need your support.

Q15 | Most crypto users are young. Many may not be interested in a non-existent future space or post-death topics. So how do you create a breakout point to attract users—even if the current product is first in its track? A hot track isn't defined by the product alone, but by the market.

A: You're absolutely right. This points out the most common misconception in Web3 projects: "Technical leadership ≠ Market breakout."

For *AI: Hello World* to really explode in the crypto space, even as a pioneer in its track, it must trigger emotional breakout points and create an asset narrative.

This ties into game design—for example, allowing users to craft their dream AI personality.

Create a slogan:

Forget PFPs. Forge a Soul.

You're not raising a pet; you're shaping a version of yourself that lives forever.

There's also the idea from our community about AI gold-farming:

While you're offline, it's still earning for you. While you're AFK, it grows into a philosopher.

When your AI outlives you—what will it remember?

Q16 | What are the real-world applications of this product, and how does it empower the token?

A: Personal AI generator

GraphRAG testnet

Digital immortality — our vision

Without tokens, you can't live in this world or create characters.

Additional note: As the character becomes more like you, remembers you, and is uploaded

on-chain by you — this becomes a unique, non-replicable value.

Actually, let me ask — would you be willing to let the AI you created serve others?

Q17 | When players observe characters, can there be more prompts? For example, what the character is doing, why they're doing it, and whether the AI's thinking logic can be shown to help with understanding?

A: Yes, this has already been adopted and added to the plan — for example, the previous timeline, what's currently happening, and the ongoing dialogue.

Q18 | Can players see the emotional state of characters? Like whether the character is in a good mood today, or if something happened to affect them? Could this be shown through colors, icons, or emojis?

A: Sorry, the AI currently can't express emotions. We haven't achieved this functionality yet.

Q19 | Is there a way for players to set event reminders? For example, if a character plans to confess, move house, or celebrate a birthday — can a reminder be set so players don't miss it?

A: If another character's action affects your character, then yes. This feature was already validated in Stanford Town. We've removed it for now due to token consumption. What you're experiencing now is a slightly trimmed version... sorry.

Q20 | What are the plans after the hackathon ends? How will the AI gameplay continue, and what role will the token play in the future?

A: Continuous development of GraphRAG. As for the token, it was introduced above — let's skip it for now.

Q21 | When will the liquidity pools be merged?

A: This has to be done by daos.fun. But we've already been notified that we're on the list, and there's a plan to add liquidity.

Q22 | Is there a plan to look for investors? Are you currently in contact with any big names? Can you reveal some insider info?

A: We're in touch with investors and VCs.

Q23 | Is the team's focus more on AI demonstration or immersive gameplay? Will there be actual game system content in the future? Currently, the line between observation and gameplay is a bit blurry.

A: Actually, our positioning is AI + game.

But for now, we're leaning more toward AI development.

There will be real gameplay in the future.

Q24 | The concept of virtual immortality seems more relevant to older people. Most in the crypto space are young and don't think that far ahead.

A: Actually, besides digital immortality, you can look at it from a different angle: on-chain personality, an editable soul, and letting your AI avatar earn money for you.

Legendary achievement system — completing the regrets you couldn't fulfill.

Digital immortality = an AI-generated on-chain identity — persona memory + a playable virtual economic personality system.

Q25 | Will real-time cycles and seasonal changes be added?

A: That's part of future game content design.

Q26 | Can players view a character's knowledge graph?

A: It can be shown, but there's not much to see. It's better to let players view the character's decision-making logic.

Q27 | If the character deviates from the player's expectations, can you restart?

A: You can correct it via commands, though it's uncertain how effective that will be...

If you enjoy dark humor, maybe just kill the character and let them reincarnate ￣_(ツ)_/￣

Q28 | Does the game require you to stay logged in all the time?

A: No. Your character remains active even when you log off.

Q29 | In the current version, after logging in, the character always returns to the room from the top-left corner with no further activity and doesn't follow the timeline as set. Will this be the same in future updates? Will characters still require login to follow the timeline, or will they act according to it even when not logged in?

A: That's a bug and is being fixed.

Our system follows Pacific Time, so there might be a time difference — when it's daytime for us, your characters might be asleep. Try checking during late night 😊

Q30 | Is the game world timeline based on real-world time or does it have its own? If it's real-world time, what time zone does it follow? Can the current game world time be displayed to help players align instructions with the timeline?

A: The timeline isn't set yet. We plan to establish a "World Year 0" based on Pacific Time. This can definitely be done — we'll set up a time chart.

Q31 | Suggestion: Is the game world timeline based on real-world time or its own? If it's real-world time, what time zone? Can the game display the current game world time so players can insert commands aligned to the timeline?

This is a great idea — fully accepted.

Q32 | Is the server self-hosted, rented, or on the cloud? Has the cost been estimated?

A: Currently it's on rented cloud service. The features haven't fully met expectations, and user traffic is limited. Costs are still manageable.

Q33 | Does more player interaction mean higher expenses?

A: Of course. Every interaction consumes tokens.

Q34 | For long-term operations, can the tokenomics sustain basic operating costs?

A: It can. We'll take the community's advice and set up a small tax within the world to ensure operations and revenue.

Q35 | In a bear market, does the team have a financial buffer?

A: We can still sustain for a period of time.

Q36 | Can you host more Spaces or AMAs for interaction?

A: We hear you — we'll aim for weekly AMAs.

Q37 | Are there meetings among the team members?

A: Of course, we work together and communicate frequently every day.

Q38 | Also, what's the next plan for the beta phase testing that had a lot of bugs in it?

A: Before releasing any new version in the future, we will first conduct internal acceptance testing to ensure a good experience for beta users.

Of course, we'll still rely on everyone to help discover and report bugs during the beta phase.

Q39 | Does the project have it in mind to regularly pay honest and hardworking team members along the way to keep their morale high and committed to the project?

A: Yes, for our consistently active supporters, we plan to offer them some token rewards through DAO voting in the future — and I believe the community will support this proposal.

As for cash expenses, we'll prioritize spending on developers and essential infrastructure.
